TRACELINK UNIVERSITY

What's new in the user interface 13.0.0 release

Explore what's new in the Administration, solution version 13.0.0 release. What's new in the system changes.

Release information

This document describes the TraceLink capabilities included in the Administration, solution version 13.0.0 release, which is available on Validation on 17 Sep 2026 and Production on 13 Oct 2026.

The following solutions are impacted by this release and will be updated to the version listed:

- Administration, solution version 13.0.0

  Apps that support this solution version:

  - Administration, version 2026.2.0

The features below are in order of functional relevance (i.e. the typical order in which a user executes a function or task).

⚠ These release notes are subject to change based on the deployment of the

© TraceLink Inc. 2009 - 2025 All Rights Reserved

release. In the event of changes, the release notes and any related documentation will be updated within one week of release deployment. Deployment completion can be confirmed in the TraceLink Release Notice email.

Revisions

Date	Revision	Description
16 Jul 2026	01	Initial version.
10 Aug 2026	02	The following updates have been made since the previous revision was distributed: • The Validation date in Release information is updated to 17 Sep 2026. • The Production date in Release information is updated to 13 Oct 2026.
25 Aug 2026	03	The following updates have been made since the previous revision was distributed: • 2 UI features are added: ◦ Search and Simplify B2B Integration Link Settings. ◦ Standardize post-save navigation across Administration screens.
17 Sep 2026	04	The following updates have been made since the previous revision was distributed: • 1 solution feature is added. ◦ Configure and Simplify Password Requirements. • 1 issue is added to Resolved Issues. • 0 issues are added to Known Issues.

UI features

The following new or updated functionality is included in this release.

Administrators Can View User Roles

Company Administrators can now view all roles assigned to a user directly from the Company Users page. The new User Roles table provides a consolidated view of user roles across Applications and Networks. This enhancement improves visibility into user access and simplifies user management by allowing Company

Administrators to quickly review assigned roles without navigating to multiple areas of the platform.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Enhanced B2B Connection Association Management

The existing Connection Association page has been split into separate Inbound Connection Rules and Outbound Connection Rules pages to simplify B2B connection management.

- The Inbound Connection Rules page displays all existing B2B Connections by default and allows users to update the associated Company or Location through a simplified interface.

- The Outbound Connection Rules page organizes outbound routing into Default Company Connection, Default Connections for Locations, and Override Default Settings, while enforcing unique routing rules to prevent duplicate configurations.

These changes simplify inbound and outbound connection management and provide a more intuitive user experience.

Generate API Keys for Integration Principal Users

System administrators can now generate API keys for Integration Principal users directly from the Integration Principal details page to simplify the setup of machine-to-machine integrations. Previously, administrators had to rely on manual processes outside the UI to generate API keys, making integration setup more time-consuming. When an Integration Principal is created, TraceLink automatically generates an API key and displays it on the Integration Principal details page. Each API key includes an access key and a private key. For security reasons, the private key can be viewed and copied only within 5 minutes of being generated. After the private key expires, a new API key must be generated.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

User Access Management Through User Groups

This release introduces User Groups, which enable System Administrators to manage network memberships and role assignments for multiple users at once. Previously, administrators had to assign network access and roles individually for each user. Now, they can assign access once at the group level and apply it to multiple users.

User Groups also strengthen governance by preventing duplicate or conflicting network access assignments. Users cannot receive access to the same network through both an individual membership and a User Group membership, or through multiple User Groups. Memberships inherited through a User Group are clearly identified and can be managed only through the associated User Group.

This enhancement reduces administrative effort, improves consistency, and helps

ensure secure and predictable access management across the platform.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Additional Identifiers in B2B Integration Link Settings

Company Administrators can now add multiple company and location identifiers in the Additional Identifiers section of B2B Integration Link Settings. Previously, Link Settings supported only a single company or location identifier, limiting customers who needed additional identifiers for specific integration scenarios. This enhancement provides more flexible B2B integration configuration by supporting multiple identifiers where needed.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Support for Managing Company Locations

OPUS Administration now includes a dedicated Manage Locations experience that enables **Track and Trace Services (TTS)** Administrators and System Administrators to search, view, and maintain company location information. This experience provides the same location management capabilities available in the TTS Manage Locations screen through a centralized interface in OPUS Administration. Administrators can:

- Locate company locations.

© TraceLink Inc. 2009 - 2025 All Rights Reserved

- Update location details, including the location name, address, participation in TraceLink applications, and Info Exchange configuration.

- Export location records.

These capabilities help administrators efficiently manage location information while providing a consistent administration experience across OPUS.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Support for Managing Company Partners

OPUS Administration now includes a dedicated Manage Partners experience that enables TTS Administrators to search, view, and maintain partner information associated with their company. The feature provides a centralized interface for locating partner records, updating partner details such as company name and partner type, and managing partner identifiers, helping administrators efficiently maintain partner information while providing a consistent administration experience across OPUS.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Single Sign-On Settings Identity Provider Controls

Company Administrators can now switch between **Company SSO** and **TraceLink**

© TraceLink Inc. 2009 - 2025 All Rights Reserved

SSO on the Single Sign-On Settings page without losing the configured Identity Provider (IdP) settings. Previously, switching from Company SSO to TraceLink SSO removed the configured IdP settings, requiring administrators to reconfigure the Identity Provider before re-enabling Company SSO. This enhancement preserves the existing IdP configuration when IdP authentication is disabled and requires an explicit administrative action to remove the configuration. As a result, administrators can switch between SSO authentication methods more efficiently while retaining existing IdP settings.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Search and Simplify B2B Integration Link Settings

Company Administrators can now search and filter Link Settings on the B2B Integration Link Settings screen to quickly locate specific B2B connection configurations. Previously, Company Administrators had to manually scroll through the Link Settings list to locate a specific configuration.

This enhancement also simplifies the New Link Settings page by displaying only the General section during initial creation. The Connection Type Information and IDoc Transaction Details sections remain available when viewing or editing a Link Setting after it is created.

Standardize post-save navigation across Administration screens

Administration screens now provide a consistent experience after users save a new record. Previously, after adding a new record, users could be redirected to a search page or a details page, depending on the screen. After a successful save, users are now redirected to the newly created record's View/Edit screen in Edit mode, allowing users to continue editing without navigating back to the record.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Configure and Simplify Password Requirements

System Administrators can now configure **Minimum Password Length** and **Minimum Number of Special Characters** directly in Single Sign-On Settings. Previously, these password requirements could only be configured through backend settings. The configured requirements automatically apply when users create, change, or reset passwords, making password policy management simpler and more efficient.

Impact analysis

- Interface options:
  - Web UI
- Business segment impacts:
  - All business segments for Owners.

Resolved issues

Administration, solution version 13.0.0

The following issues are resolved in this release. The prefixes are for internal

© TraceLink Inc. 2009 - 2025 All Rights Reserved

TraceLink tracking purposes and do not mean anything to customers.

ID	Interface	Issue Description
CMCP-40797: Network and App Screens Display Inconsistent Values	Web UI	Network and Apps screens displayed mismatched or missing network and application values between the search and details screens. Both screens now display consistent network and application information. This issue is resolved.

Known issues

There are no known issues in this release.
